

Action Plan

Galina

Introduction

We have a rich history of international collaboration with tourism organizations particularly those who cater for travel for hunting and fishing, ecological tourism and extreme tourism. All of these activities exploit the natural resources. It is nature for men, not men for nature. The question is:

How to teach men to see and hear nature?

It is impossible to imagine the world of wilderness by hearing or reading about it, seeing it is absolutely necessary. A photographer, who with love captures some instances of world wilderness creates this opportunity.

Goal

Teaching humans to see and hear nature!

Barriers

1. Limited time to observe
2. Limited good light conditions (generally in the early morning and evening)
3. Limited choice of places and objects to photograph

Benefits

1. Many people have cameras
2. The natural areas have resources, transport systems and places to rest.
3. We have rangers ecologists and scientists who love nature who can help the photographers

Actions	Indicators of Success	Resources Needed
Classifying and selecting suitable information to include on the existing website	Photographers use the information provided	While there is a computer network the communications system needs to be upgraded
Choose the right season and time for photography for specific protected areas and nearby natural and cultural resources.	Many reserves express interest and support for the project	Improved road access in winter.
Photographers take photos	Numbers of photographers	Staff need to set aside time

	come to take the photos	to monitor impacts.
--	-------------------------	---------------------

Key Stakeholders

All nature reserves, national parks and monuments of nature etc.

Benefit Positively

School children looking for illustrations and information

Staff who work in the parks and reserves

All nature lovers

Scientists, ecologists etc

Negatively Impacted

Many reserves expect to be paid for the work or retain the original negatives.

The extensive use of the likes of the internet may cause communication problems on an already unstable communication network.
